

Attitudes and actions to foster children's interest in science

- Show an active interest in the world and beyond.
- Encourage an investigative attitude and support their collections of things that interest them.
- Observe natural phenomena together; for example, watch an approaching storm and discuss the senses used to experience it (what you can see, hear, feel, smell and taste).
- Encourage them to find out the answers to their questions, or find out together, through experiments, investigations or research.
- Attend lectures, watch documentaries, visit museums, and talk with experts in different branches of science.
- Help them verify information with reference to other sources.
